

Incident Management Lifecycle Automation in ServiceNow

Phase 5 – Project Development Phase

1. Development Environment

The solution is implemented and tested in a ServiceNow Personal Developer Instance using Service Operations Workspace and related ServiceNow capabilities.

2. Service Configuration

A service named Remote Access is configured with an operational status. A service offering named Corporate VPN is created under Remote Access.

3. Incident Scenario

The primary scenario is an inability to connect to the Corporate VPN from a home office. The incident is created with caller, description, service context and priority, then routed to the Network support team.

4. Incident Lifecycle Implementation

1. Create the incident.
2. Classify the issue and associate service/service offering.
3. Set impact, urgency and priority.
4. Assign to Network and an appropriate agent.
5. Move through the configured lifecycle.
6. Use troubleshooting knowledge.
7. Escalate or create a child incident when required.
8. Create/link a change request when required.
9. Document resolution and resolve the incident.
10. Verify related records and SLA tracking.

5. Child Incident Management

A child incident is associated with the parent incident. During validation, the child reaches Resolved and the activity history records that it was resolved based on the parent incident.

6. Change Integration

A change request is created and linked to the parent incident. The implemented example uses CHG0030001, providing traceability between the incident and change process.

7. Knowledge Creation

Knowledge Management supports troubleshooting and preservation of reusable information. The incident is validated with created and attached knowledge records.

8. SLA Tracking

Task SLA records are associated with the incident and visible through Related Records. Response and resolution SLA information can be monitored as part of the lifecycle.

9. Testing and Validation

Test Area	Expected Result	Observed Evidence
Incident lifecycle	Incident reaches Resolved	Parent incident is Resolved
Escalation	Assignment/handling changes traceable	Network assignment and activity
Change integration	Change request linked	CHG0030001
Knowledge creation	Knowledge available	Created/Attached Knowledge
Child incident	Child reaches Resolved	Parent-resolution activity
SLA tracking	Task SLA records visible	Task SLAs related list
Collaboration	Support ownership traceable	Assignment and activity

10. Validation Checklist

- Parent incident state = Resolved.
- Child incident state = Resolved.
- Activity shows resolution triggered by the parent incident.
- CHG0030001 is linked.
- Knowledge article is created/attached.
- Task SLA records are visible.
- Assignment group and assigned agent are visible.
- Activity provides traceability.

11. Deployment Readiness

Before production deployment, configuration should be reviewed, tested with appropriate roles, documented and validated against organizational change-control requirements. For this academic implementation, the PDI is the development and demonstration environment.

12. Final Development Outcome

The completed implementation demonstrates a structured Incident Management lifecycle with escalation, child incidents, Change Management, Knowledge Management, SLA tracking and activity-based traceability.
